

A
PROJECT REPORT
ON

“Student Information Management System”

**Submitted in partial fulfillment for the
Award of degree of
Bachelor of Technology in computer Science And Engineering**

Submitted by:

**HARSHIT
KUMAR**

Submitted to:

Head of Department
(Mr. AJAY SINGH)

(Department of Computer Science And Engineering)

(2021-2022)

PREFACE

This project “**Student Information Management System**” provides us a simple interface for maintainance of student information.It can be used by educational institutes or colleges to maintain the records of students easily. Achieving this objective is difficult using a manual system as the information is scattered, can be redundant and collecting relevant information may be very time consuming. All these problems are solved using this project.

Throughout the project the focus has been on presenting information in an easy and intelligible manner. The project is very useful for those who want to know about Student Information Management Systems and want to develop softwares/websites based on the same concept.

The project provides facilities like online registration and profile creation of students thus reducing paperwork and automating the record generation process in an educational institution.

ACKNOWLEDGEMENT

We take this opportunity to express our sincere gratitude to all those who helped us in various capacities in undertaking this project and devising the report.

We are privileged to express our sense of gratitude to our respected teacher **Mr. VHABAV** whose unparalleled knowledge, moral fiber and judgment along with his know-how, was an immense support in completing the project.

We are also grateful to **Mr. AJAY SINGH** the Head of Department, computer Science And Engineering, for the brainwave and encouragement given.

We take this opportunity also to thank our friends and contemporaries for their co-operation and compliance.

Harshit kumar

2021-2022

Department Of computer Science And Engineering

CERTIFICATE

This is to certify that the project titled

“STUDENT INFORMATION MANAGEMENT SYSTEM”

is a bonafied work carried out by following computer
science students.

Harshit kumar

Under our guidance towards the partial fulfillment of the Requirements
for the degree of the Bachelor of Technology by BHAGWANT
INSTITUTE OF TECHNOLOGY MUUZAFFANAGAR, during the
academic year of 2021-2022

GUIDE

(Mr. VHABAV)

HEAD OF DEPARTMENT

(Mr. AJAY SINGH)

SYNOPSIS

Abstract

Student Information Management System can be used by education institutes to maintain the records of students easily. Achieving this objective is difficult using a manual system as the information is scattered, can be redundant and collecting relevant information may be very time consuming. All these problems are solved using this project.

Name of the Project: Student Information Management System

Objectives:

- ☐ Online registration of students
- ☐ Maintenance of student records
- ☐ Searching student records

Users Views:

- ☐ Administrator
- ☐ Student

Platform

Operating Systems: Microsoft Windows

SOFTWARE REQUIREMENT SPECIFICATION

Technologies Used:

- ☐ Front End: HTML ,CSS and Javascript
- ☐ Web designing language: PHP
- ☐ RDBMS(Back end): MySQL

Software Requirements:

- ☐ PHP 5.0
- ☐ APACHE HTTP Server
- ☐ Dreamweaver,FrontPage for Front End Programming
- ☐ Microsoft Windows or Linux

Hardware Requirements:

- ☐ Intel Pentium IV processor or equivalent or higher
- ☐ 512 MB Ram or Higher
- ☐ 20 GB HDD or Higher
- ☐ Network Connectivity

Student information System

1. Introduction

1.1 Purpose:

The objective of **Student information System** is to allow the administrator of any organization to edit and find out the personal details of a student and allows the student to keep up to date his profile .It'll also facilitate keeping all the records of students, such as their id, name, mailing address, phone number, DOB etc. So all the information about an student will be available in a few seconds.

Overall, it'll make Student Information Management an easier job for the administrator and the student of any organization.

The main purpose of this SRS document is to illustrate the requirements of the project **Student information System** and is intended to help any organization to maintain and manage its student's personal data.

1.2 Scope :

Without a **Student information System**, managing and maintaining the details of the student is a tedious job for any organization.

Student Information system will store all the details of the students including their background information, educational qualifications, personal details and all the information related to their resume .

Login module: Login module will help in authentication of user accounts .Users who have valid login id and password can only login into their respective accounts.

Search module: Suppose there are hundreds of students and from this we have to search a particular student and we know the name of the student .In manual system it is a tedious task though we know the name of the student, but using this module we can easily search the student by specifying the name of the student in the search criteria. Thus this module will help the administrator in searching the student with various criteria easily.

Registration Module and Account Management: This module will help the student get registered from anywhere if internet is present .This module will really simplify the task of on paper registration. Also after successful registration the user can update information and change their password as and when required.

User Management: This module will help the administrator in enabling/disabling a user account and updating user information as required.

Purpose of project is to maintain details of the students such as storing information about:

- ☐ Student id
- ☐ Student password
- ☐ Student name
- ☐ Student DOB
- ☐ Student mailing address

- ☐ Gender
- ☐ Registration date
- ☐ Student status
- ☐ Contact no
- ☐ Qualification
- ☐ City
- ☐ Resume
- ☐ Image

1.3 Definitions, Acronyms and Abbreviations :

- ☐ **Personal details:** Details of student such as user id, phone number, address, image, resume, e-mail address etc.
- **Contact details:** Details of contact associated with the student.
- **SRS:** System requirement Specification
- **WWW:** World Wide Web

- **Administrator:** A Login Id representing the user is an administrator & can access all the records details

1.4 Technologies :

- PHP.
- MYSQL
- JAVASCRIPT
- HTML
- CSS

1.5 Overview:

The rest of this SRS is organized as follows:

Section 2 gives an overall description of the software. It gives what level of proficiency is expected of the user, some general constraints while making the software.

Section 3 gives specific requirements which the software is expected to deliver. Some performance requirements and constraints are also given and deal with other Non-Functional Requirements.

Section 4 deals with External Interface Requirements like Hardware and Software Interface.

2. OVERALL DESCRIPTION

2.1 Product Perspective :

The website **Student Information System** is aimed towards recording a considerable number of student records and needs online assistance for managing records of students. Website should be user-friendly, 'quick to learn' and reliable website for the above purpose.

Student Information System is intended to be a stand-alone product and should not depend on the availability of other website. The system will also have an administrator who has full-fledged rights with regards to performing all actions related to control and management of the website.

2.2 Product Functions :

There are two different users who will be using this product:

- ☐ Administrator who can view and edit the details of any students.
- ☐ Students who can view their details as well as they can edit their details.

The features that are available to the Administrator are:

- ☐ An Administrator can login into the system and perform any of the available operations
 - ☐ Can enable/disable student.
 - ☐ Can edit student information to the database.
 - ☐ Can make search for a specific student.
 - ☐ Can access all the details of the student.

The features that are available to the student are:

- ☐ Student can login into the system and can perform any of the available options.
- ☐ Can view his/her personal details.
- ☐ Can edit his/her personal details
- ☐ Can upload his/her resume.
- ☐ Can upload his/her image.

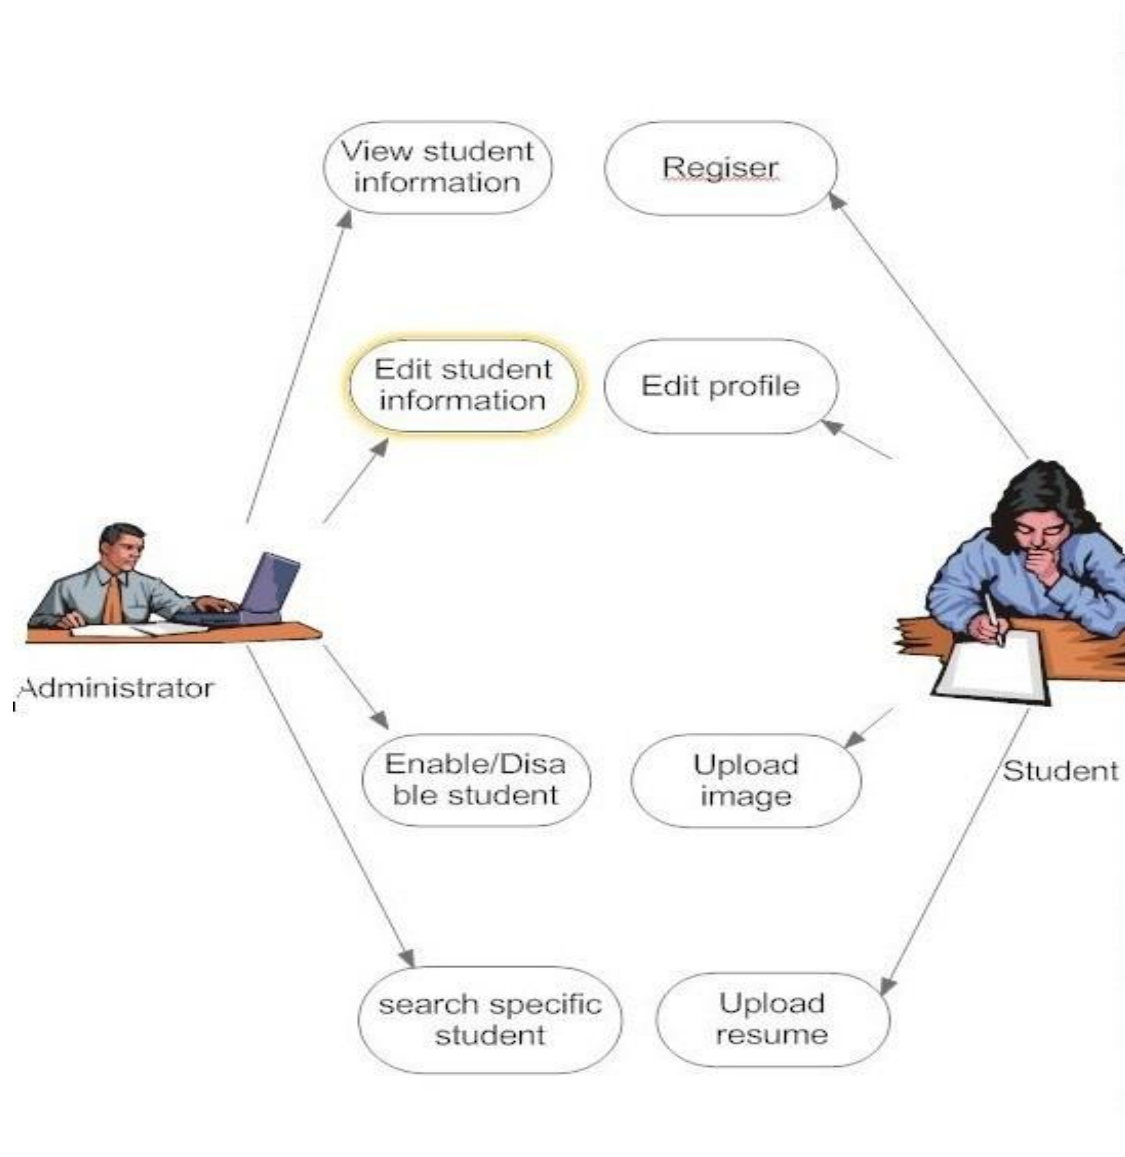

2.3 Operating Environment :

The product can run on any browser.

2.4 Constraints :

- ☐ Every user must be comfortable using computer.
- ☐ All operations are in English so user must have basic knowledge of English.

2.5 USE CASE MODEL :

Use Case Model

1. **Administrator:** Responsible for managing student records.
 - Login into the website
 - Update student details
 - Search student details
 - Display student details
 - Enable/Disable student
2. **Student:** Has the access rights to view and edit their personal details.
 - Login into the website
 - Display student details
 - Edit their details
 - Upload their images
 - Upload their resumes

2.6 Assumptions & dependencies

- Administrator is created in the system already.
- Roles and tasks are predefined.

3 Specific Requirements :

3.1 Use Case Reports

1. **Administrator:** Responsible for managing student details.

Use-case: Login into the website

Goal in context: Gain access to the website

Brief Description: This use case is used when the administrator wants to access the website to enable/disable/update the personal details of the student.

Preconditions: The Administrator must be logged onto the website in order for this use case to begin.

Basic Flow:

- ☐ The Website prompts the administrator for the user name and password.
- ☐ The Administrator enters the user name and password.
- ☐ The Website verifies the password and sets the user's authorization.
- ☐ The Administrator is given access to the Website to perform his tasks.

Alternative Flow:

- ☐ The administrator enters invalid username and password then he will not be allowed to enter the website.

Post conditions: The website state is unchanged by this use case.

Use Case Report- Login into the website

Use Case : Display student details

Goal in context: View the details of a student

Brief Description: This use case is used when the administrator wants to view the personal details of the students already existing in the database on the screen.

Preconditions:

- ☐ The Administrator must be logged into the system in order for this use case to begin
- ☐ The details of the student must pre-exist in the database
- ☐ The student id must be entered correctly.

Basic Flow:

- ☐ The Administrator logs onto the System.
- ☐ The Administrator search the student from following keys:-
 - Student id
 - First/last name
 - Registration date
 - status

- ☐ The System prompts for the student detail from one of the above keys.
- ☐ The student details are displayed on the screen.

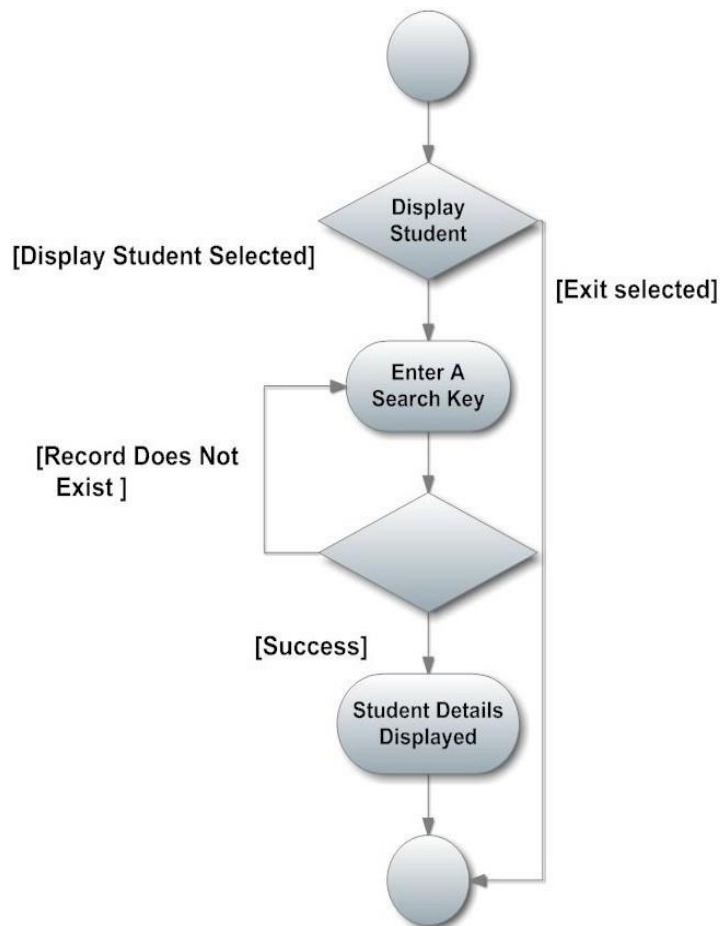

Alternative Flow:

Student Not Found

If in the **Display a student** sub-flows, a student with the specified id number does not exist, The system displays an error message. The Administrator can then enter a different id number or cancel the operation, at which point the use case ends.

Post conditions:

The student details are displayed on the screen already existing in the system. The state of the system remains unchanged.

Use Case Report-Display Student Details

Use Case : Edit student details

Goal in context: Edit the details of a student

Brief Description: This use case is used when the administrator wants to edit the personal details of the himself/herself already existing in the database.

Preconditions:

- ☐ The Administrator must be logged into the system in order for this use case to begin.
- ☐ The details of the student must pre-exist in the database

Basic Flow:

- ☐ The Administrator logs onto the System.
- ☐ The Administrator can edit following keys:-
 - First/last name
 - Gender
 - DOB
 - Contact no
 - Qualification
 - City
 - Email1
 - Email2
 - Address
 - Description
- ☐ The Website updates the database according to edited details.
- ☐ The student details are edited in the database.

Alternative Flow:

There is no alternative flow of this use case diagram.

Post conditions:

The student details get updated in the database.

Use Case Report- Edit student detail into the website

2. Student

Use Case : student registration

Goal in context: Registration of a student

Brief Description: This use case is used when the student register himself/herself in the database online.

Preconditions:

- ☐ The Student must accessed the website in order for this use case to begin.
- ☐ The user id must be unique and entered correctly.

Basic Flow:

- ☐ The Student enters into the website.
- ☐ The student fill his/her details from the following keys:-
 - Student id
 - password
 - First/last name
 - Status
 - Gender
 - DOB
 - Contact no
 - Qualification
 - City
 - Email1
 - Email2
 - Address
 - Description

- Resume
- Image

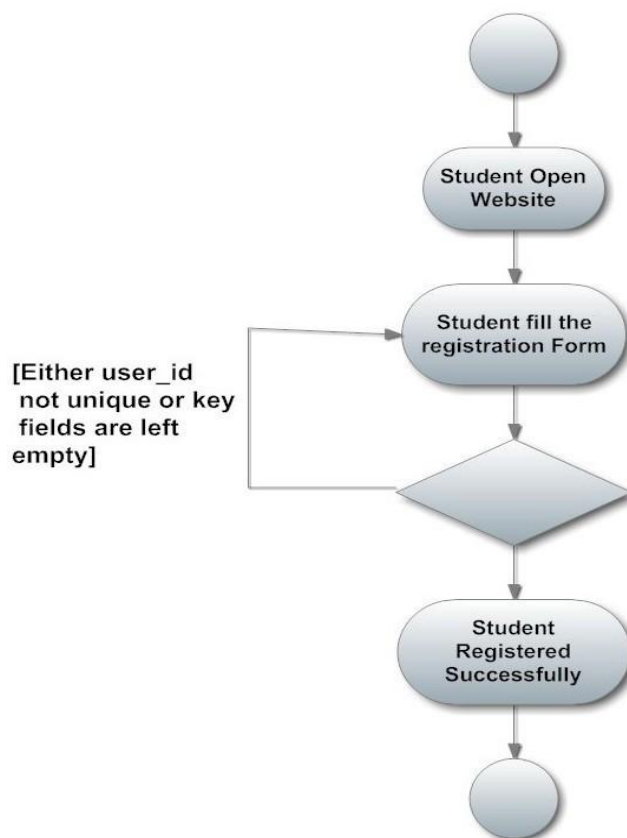

- ☐ The System details are added to the database.
- ☐ The student details are displayed on the screen.

Alternative Flow:

User ID not unique: if the user id entered is not unique then it will show an error message.

Post conditions:

The student get registered on the website and to login into that particular the administrator must enable it.

Use Case Report- Register student on website

Use-case: Login into the website

Goal in context: Gain access to the website

Brief Description: This use case is used when the student wants to access the website

Preconditions: The Administrator must enabled the particular student onto the website in order for this use case to begin.

Basic Flow:

- ☐ The website prompts the student for the user name and password.
- ☐ The Student enters the user name and password.
- ☐ The website verifies the password and sets the user's authorization.
- ☐ The Student is given access to the website to perform his tasks.

Alternative Flow:

- ☐ The Student enters invalid username and password then he will not be allowed to enter the website.

Post conditions: The website state is unchanged by this use case.

Use Case Report- Login into the system

Use Case : Edit student details

Goal in context: Edit the details of a student

Brief Description: This use case is used when the student wants to edit the personal details of the himself/herself already existing in the database.

Preconditions:

- ☐ The Student must be logged into the system in order for this use case to begin.
- ☐ The details of the student must pre-exist in the database
- ☐ The student must be enabled by administrator.

Basic Flow:

- ☐ The Student logs onto the System.
- ☐ The Student can edit following keys:-
 - First/last name
 - Gender
 - DOB
 - Contact no
 - Qualification

- City
- Email1
- Email2
- Address
- Description

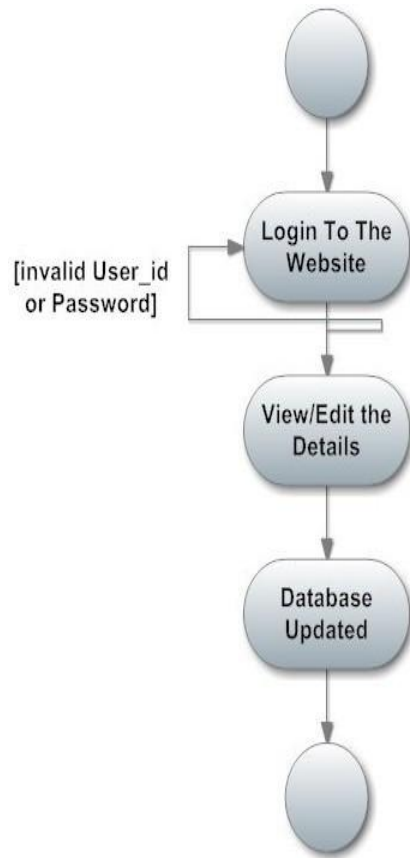

- ☐ The Website updates the database according to edited details.
- ☐ The student details are edited in the database.

Alternative Flow:

There is no alternative flow of this use case diagram.

Post conditions:

The student details get updated in the database.

Use Case Report- Edit Student Details Into Database

3.2 Functional Requirements :

- ☐ The Administrator will be given more powers (enable/disable/ update) to other users.
- ☐ It will be ensured that the information entered is of the correct format. For example name cannot contain numbers. In case if incorrect form of information is added, the user will be asked to fill the information again.
- ☐ The system can be accessed anytime.

3.3 Non- Functional Requirement :

3.2.1. Performance Requirements:

The proposed system that we are going to develop will be used as the Chief performance system for providing help to the organization in managing the whole database of the student studying in the organisation. Therefore, it is expected that the database would perform functionally all the requirements that are specified.

3.2.2. Safety Requirements:

The database may get crashed at any certain time due to virus or operating system failure. Therefore, it is required to take the database backup.

3.2.3. Security Requirements:

We are going to develop a secured database. There are different categories of users namely Administrator, Student who will be viewing either all or some specific information from the database.

Depending upon the category of user the access rights are decided. It means if the user is an administrator then he can be able to modify the data, append etc. All other users only have the rights to retrieve the information about database.

3.4 Conclusion :

This SRS has given all the details of the application need to be built.

DESIGN PHASE

1. Introduction

1.1) Scope and purpose

The purpose of the design phase is to develop a clear understanding of what the developer want people to gain from his/her project. As you the developer work on the project, the test for every design decision should be "Does this feature fulfill the ultimate purpose of the project?"

A purpose statement affects the design process by explaining what the developer wants the project to do, rather than describing the project itself.

The Design Document will verify that the current design meets all of the explicit requirements contained in the system model as well as the implicit requirements desired by the customer.

1.2) Overall System Design Objectives

The overall system design objective is to provide an efficient, modular design that will reduce the system's complexity, facilitate change and result in an easy implementation. This will be accomplished by designing strongly cohesion system with minimal coupling. In addition, this document will provide interface design models that are consistent user friendly and will provide straight forward transition through the various system functions.

1.3) Structure of Design Document

□ *System Architecture Design* – The System architecture section has detailed diagram of the system, server and client architecture.

- *Data Design* – The data Design include an ERD as well as Database design.
- *Functional Design Description* – This section has the functional partitioning from the SRS, and goes into great detail to describe each function.

2. System Architecture Design

2.1) System Architecture

The SIMS is a system which contain major part which include: student Detail, Student image and resume.

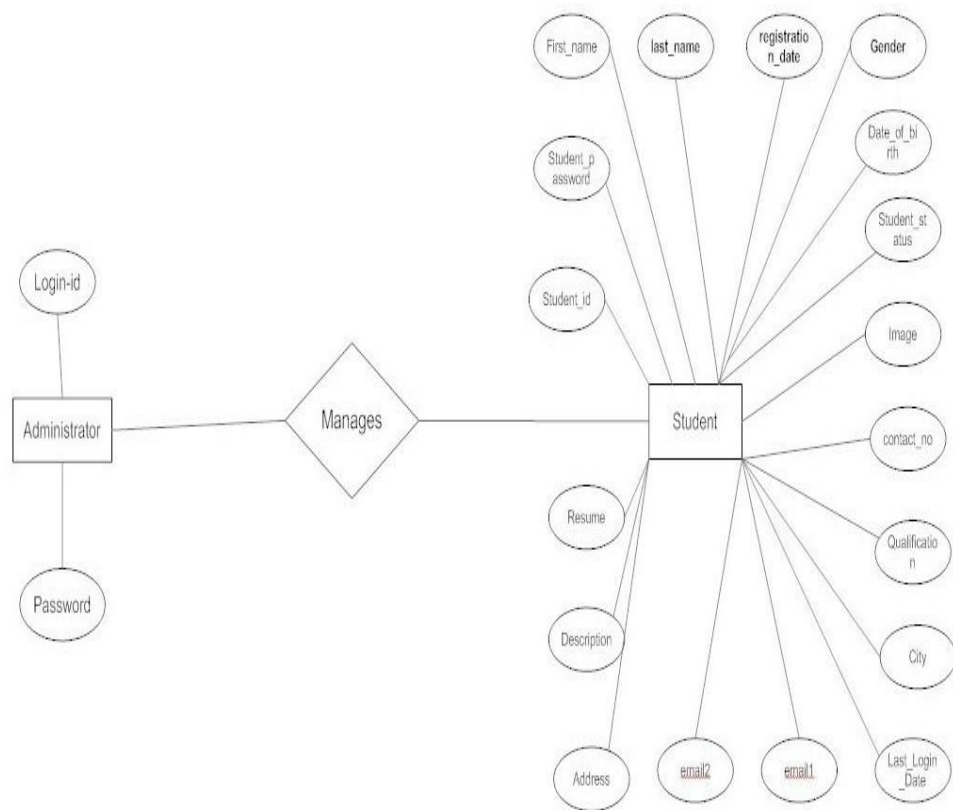

The user selects one of the available options as an input to the system. According to the input by the user the system acts and the rest of the functions are performed accordingly. The administartor can operate on any student details. But the normal student or users can only access their details of all the functionalities.

Architecture Diagram

3. Data Design

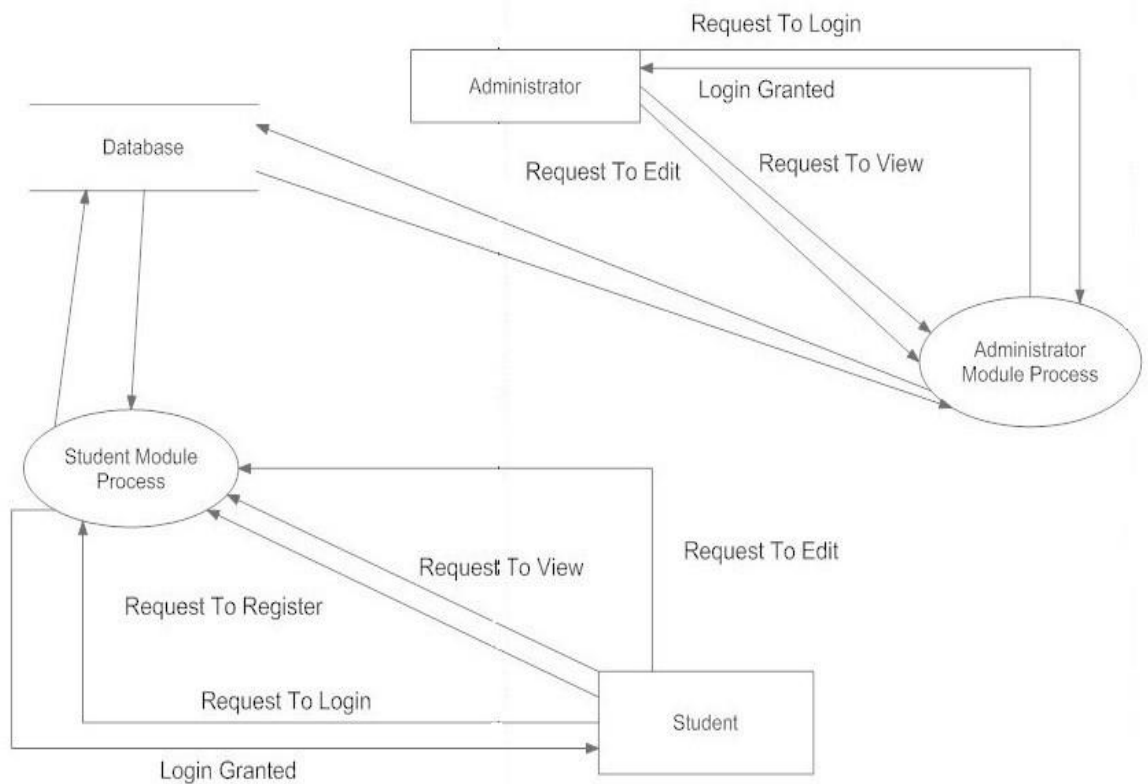

3.1) Entity Relationship Diagram :

Entity Relationship Diagram

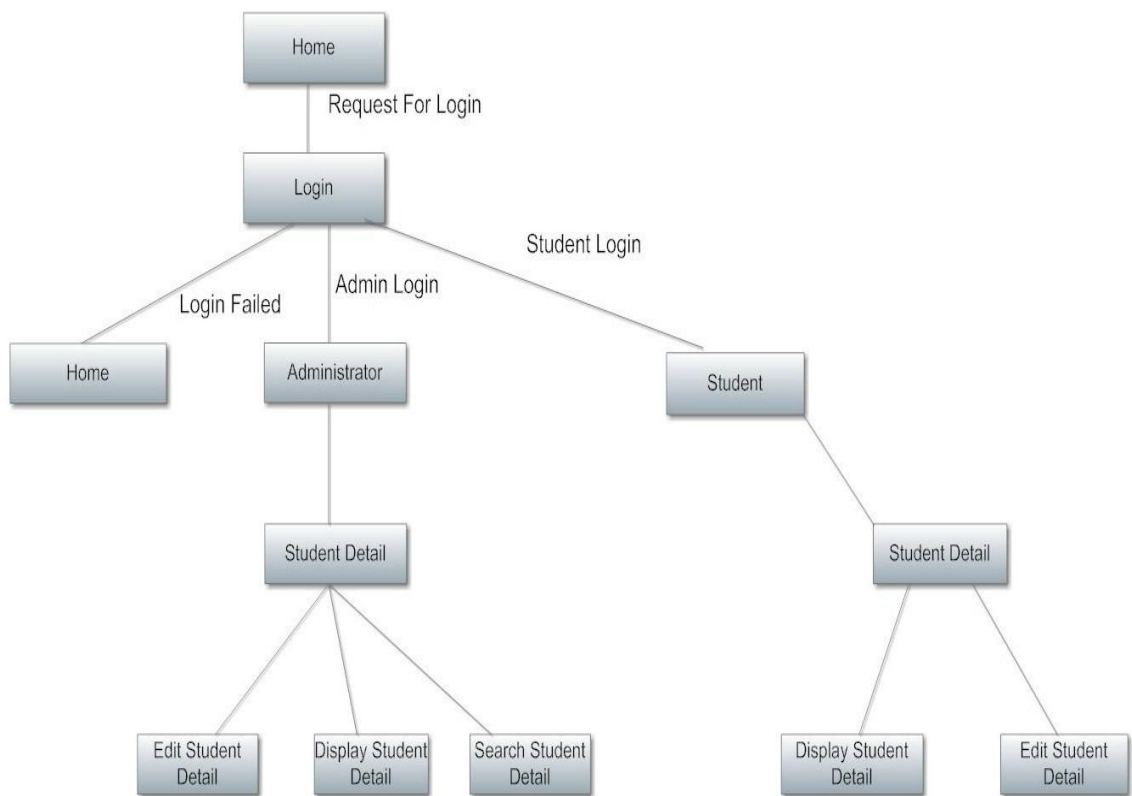

4. Functional Design Description

4.1 Data Flow Diagram :

Data Flow Diagram

4.2 Decision Tree :

DECISION TREE

5. Conclusion

Hence we can conclude that the design phase of the SIMS give us the information of all the processes used in the project and their relation.

TECHNOLOGY OVERVIEW

The technology selected for implementing Student Information Management System is PHP/MYSQL. Apache is used as the HTTP server. The development was done in a 'windows' environment using adobe dreamweaver CS5.

PHP

PHP is a general-purpose scripting language that is especially suited to server-side web development where PHP generally runs on a web server. PHP code is embedded into the HTML source document. Any PHP code in a requested file is executed by the PHP runtime, usually to create dynamic web page content. It can also be used for command-line scripting and client-side GUI applications. PHP can be deployed on many web servers and operating systems, and can be used with many relational database management systems (RDBMS). It is available free of charge, and the PHP Group provides the complete source code for users to build, customize and extend for their own use.

MySQL

MySQL is a relational database management system (RDBMS)^[1] that runs as a server providing multi-user access to a number of databases. MySQL is a popular choice of database for use in web applications and is an open source product. The process of setting up a MySQL database varies from host to host, however we will end up with a database name, a user name and a password. Before using our

database, we must create a table. A table is a section of the database for storing related information. In a table we will set up the different fields which will be used in that table. Creating a table in phpMyAdmin is simple, we just type the name, select the number of fields and click the 'go' button. we will then be taken to a setup screen where you must create the fields for the database. Another way of creating databases and tables in phpMyAdmin is by executing simple SQL statements. We have used this method in order to create our database and tables.

Apache

The Apache HTTP Server is a web server software notable for playing a key role in the initial growth of the World Wide Web. In 2009 it became the first web server software to surpass the 100 million web site milestone. Apache is developed and maintained by an open community of developers under the auspices of the Apache Software Foundation. Since April 1996 Apache has been the most popular HTTP server software in use. As of November 2010 Apache served over 59.36% of all websites and over 66.56% of the first one million busiest websites.

XAMPP

XAMPP is a small and light Apache distribution containing the most common web development technologies in a single package. Its contents, small size, and portability make it the ideal tool for students developing and testing applications in PHP and MySQL. XAMPP is available as a free download in two specific packages: full and lite. While the full package download provides a wide array of development tools, XAMPP Lite contains the necessary technologies that meet the Ontario Skills Competition standards. The light version is a small package containing Apache HTTP Server, PHP, MySQL, phpMyAdmin, Openssl, and SQLite.

Obtaining and Installing XAMPP

As previously mentioned, XAMPP is a free package available for download and use for various web development tasks. All XAMPP packages and add-ons are

distributed through the Apache Friends website at the address: <http://www.apachefriends.org/>. Once on the website, navigate and find the Windows version of XAMPP and download the self-extracting ZIP archive. After downloading the archive, run and extract its contents into the root path of a hard disk or USB drive. For example, the extract path for a local Windows installation would simply be C:\. If extracted properly we will notice a new xampp directory in the root of your installation disk. In order to test that everything has been installed correctly, first start the Apache HTTP Server by navigating to the xampp directory and clicking on the apache_start.bat batch file.

Next we will test if the server is running correctly by opening an internet browser and typing <http://localhost/> into the address bar. If configured correctly, we will be presented with a screen similar to that of the one below.

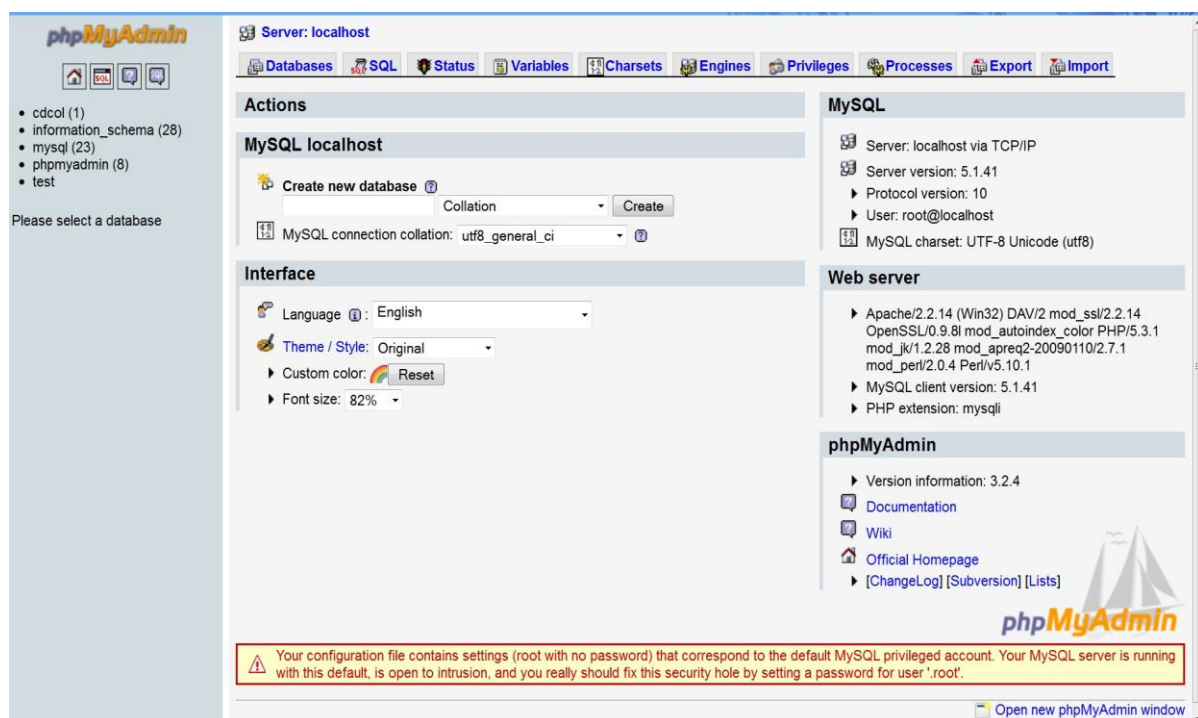

XAMPP splash screen.

In order to stop all Apache processes we do not close the running terminal application, but instead run another batch file in the xampplite directory called `apache_stop.bat`.

Creating a Database and Inserting Data

Now that we have run and tested Apache and PHP, the next step is running MySQL and creating a database and table which will hold information to be used by our website. In order to start MySQL, navigate to the xampp directory and run the `mysql_start.bat` batch file. The XAMPP package contains an application called phpMyAdmin which allows developers to administer and maintain MySQL databases. We will be using phpMyAdmin to create a database and table, and enter test data. Before testing phpMyAdmin, make sure that both Apache and MySQL are running by opening their respective batch files: `apache_start.bat` and `mysql_start.bat`. Along with Apache and MySQL running in the background, we type `http://localhost/phpMyAdmin/` into our web browser. If successful we will be presented with a phpMyAdmin start page similar to the one shown below.

phpMyAdmin start page

The first step with phpMyAdmin running is creating a new database. We create a new database by directly executing SQL statements as shown below. The successful execution of the sql query creates a database 'student' with two tables in it. The tables are admin_login and student_information. We also inserted values in the admin table. The screenshot below shows the successful execution of the query thus creation of a database named student.

The screenshot displays the phpMyAdmin web interface. On the left sidebar, there is a list of databases: cdccl (1), information_schema (28), mysql (23), phpmyadmin (8), student (2), and test. Below this list is the text "Please select a database". The main content area shows the "Server: localhost" header with navigation tabs for Databases, SQL, Status, Variables, Charsets, Engines, Privileges, Processes, Export, and Import. The "SQL" tab is active, and a green message bar at the top states "Your SQL query has been executed successfully". Below this, the executed SQL query is shown in a code editor:

```
CREATE DATABASE student; # 1 row(s) affected.
USE student; # MySQL returned an empty result set (i.e. zero rows).
CREATE TABLE admin_login (
  user_id VARCHAR(30) PRIMARY KEY,
  PASSWORD VARCHAR(20),
  last_login_date TIMESTAMP
); # MySQL returned an empty result set (i.e. zero rows).
INSERT INTO admin_login (user_id,
  PASSWORD )
VALUES (
  'admin', 'admin')
```

Buttons for "Edit" and "Create PHP Code" are visible. Below the query editor, there is a section "Run SQL query/queries on server 'localhost':" with a text area containing the same SQL query. At the bottom of this section, there are checkboxes for "Bookmark this SQL query:", "Let every user access this bookmark", and "Replace existing bookmark of same name". A "Go" button is located at the bottom right of the query execution area.

Creation of database in mysql using phpMyadmin

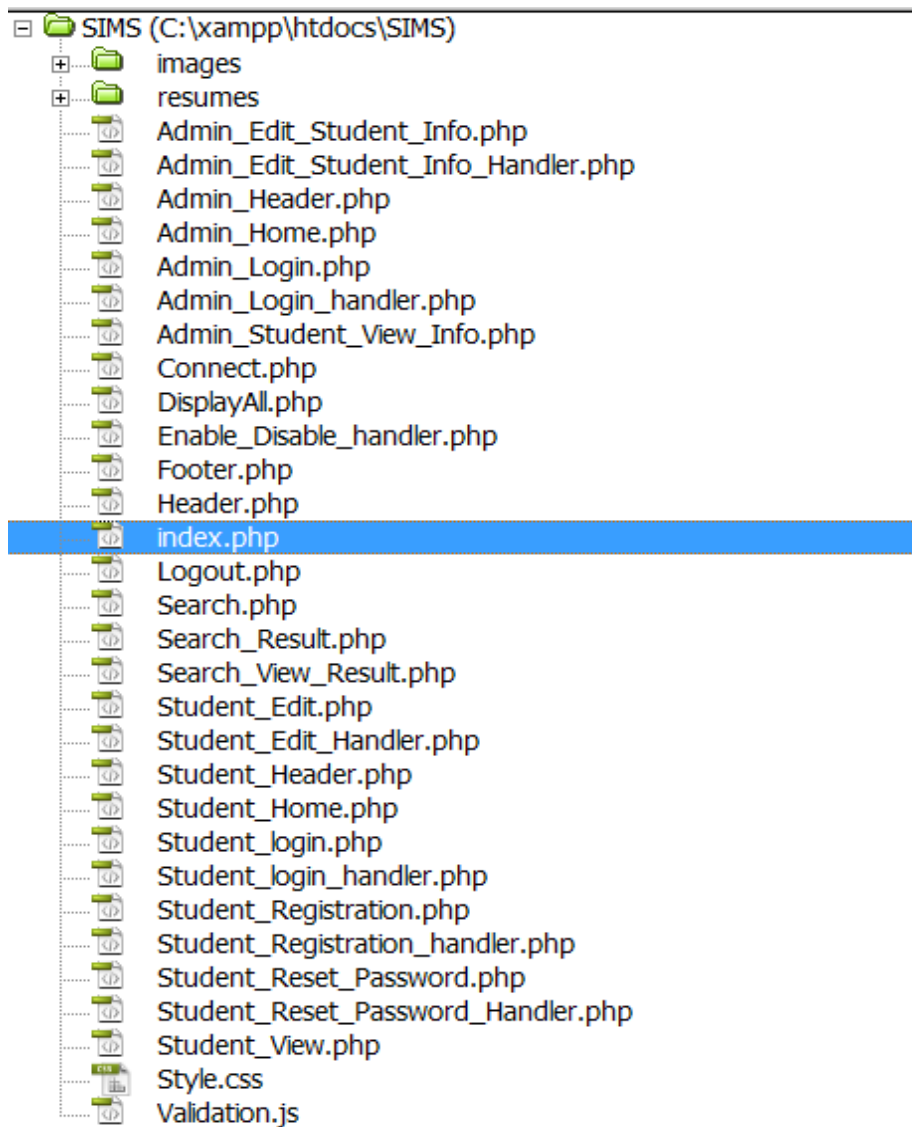

Thus we have learned to create a database in MYSQL by executing sql statements. After creating the database and tables we are now ready to use them in our website “Student Information Management System” .

PROJECT DESCRIPTION

Introduction

Student Information Management System can be used by education institutes to maintain the records of students easily. Achieving this objective is difficult using a manual system as the information is scattered, can be redundant and collecting relevant information may be very time consuming. All these problems are solved using this project

The directory structure of the project is as follows:

Description of root directory contents

- ☐ **Images Directory** : This directory contains the images uploaded by the students during registration process. Supported formats are the .jpg and .gif files.
- ☐ **Resume Directory** : This Directory Contains resumes of students uploaded during registration process of students. Files in this folder can be of .doc, .txt or .pdf format.
- ☐ **Admin_Edit_Student_Info.php** : Admin page for editing information of a student. The administrator can change details of a student in this page. Though facility of changing the image and resume are not yet provided but will be provided in future versions of the project.

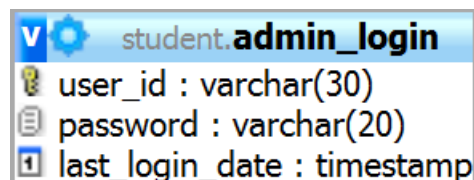

- ☐ **Admin_Edit_Student_Info_Handler.php** : Page handler for handling the Admin_Edit_Student_Info.php file. It writes the edited values in the database on the server.
- ☐ **Admin_Header.php** : Header file for pages accessible to administrator only.
- ☐ **Admin_Home.php** : Home page for administrator after logging in process.
- ☐ **Admin_Login.php** : Login page for administrator access. Shows appropriate message for wrong username and/or password.
- ☐ **Admin_Login_handler.php** : Page handler for Admin_Login.php page. It checks the values provided with the values in the database.
- ☐ **Admin_Student_View_Info.php** : Page to display student information to the administrator.
- ☐ **Connect.php** : Page for database connectivity. It is used whenever database values are required on the page.
- ☐ **DisplayAll.php** : Page to display all registered students to the administrator. This facility is only available to the administrator.
- ☐ **Enable_Disable_handler.php** : Handler page for enabling/disabling of students account facility. This functionality is only available to the administrator.
- ☐ **Footer.php** : Footer file for all pages.
- ☐ **Header.php** : Header file for login page and homepage of the site.
- ☐ **Index.php** : Homepage of the website.
- ☐ **Logout.php** : Logout handler page. It Destroys all session variables thus ending user session.
- ☐ **Search.php** : Search page to search students. It can only be used by administrator. Students can be searched using different fields such as user id, account status etc.
- ☐ **Search_Result.php** : Page to display search results to the administrator.

- ☐ **Search_View_Result.php** : Page to display student information for any selected search result.
- ☐ **Student_Edit.php** : Page to edit student information.It can be accessed by students.
- ☐ **Student_Edit_Handler.php** : Page handler for Student_Edit.php.
- ☐ **Student_Header.php** : Header file for student pages.
- ☐ **Student_Home.php** : Home page for students after they log into their respective accounts.
- ☐ **Student_login.php** : Login Page for student login. Appropriate message is displayed if the login is unsuccessful.
- ☐ **Student_login_handler.php** : Page handler for Student_Login.php.It checks the values provided with that in the database.
- ☐ **Student_Registration.php** : Student Registration page.The students enters various details here for registration.
- ☐ **Student_Registration_handler.php** : Page Handler for handling the Student_registration.php.It adds value to the student_information table thus creating a new user.
- ☐ **Student_Reset_Password.php** : Page for resetting password.It can be used only by students.Administrator password can be changed only by changing the values in the table directly.
- ☐ **Student_Reset_Password_Handler.php** : Page handler for handling page Student_Reset_Password.php.
- ☐ **Student_View.php** : Page to display student profile with all the details of the student.
- ☐ **Style.css** : Stylesheet for the whole site design.

- **Validation.js** : Javascript validations used for validation of form values.
Various form entries are validated at the client side using this file only.

Description of database tables

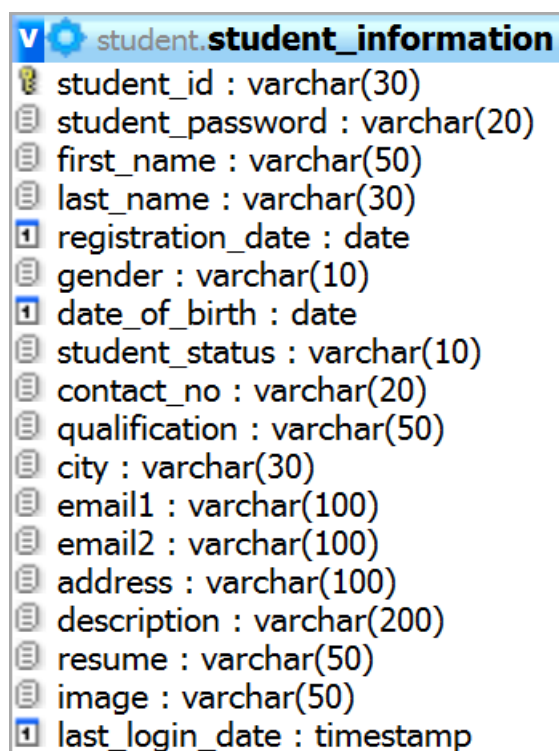

- **admin_login** :

| student.admin_login | |
|---------------------|-------------|
| user_id | varchar(30) |
| password | varchar(20) |
| last_login_date | timestamp |

- user_id : Stores user id of administrator(s).
- password : Stores password of the administrator(s).
- last_login_date : Stores the last login date of the administrator(s).

- **Student_information** :

| student.student_information | |
|-----------------------------|--------------|
| student_id | varchar(30) |
| student_password | varchar(20) |
| first_name | varchar(50) |
| last_name | varchar(30) |
| registration_date | date |
| gender | varchar(10) |
| date_of_birth | date |
| student_status | varchar(10) |
| contact_no | varchar(20) |
| qualification | varchar(50) |
| city | varchar(30) |
| email1 | varchar(100) |
| email2 | varchar(100) |
| address | varchar(100) |
| description | varchar(200) |
| resume | varchar(50) |
| image | varchar(50) |
| last_login_date | timestamp |

- student_id : Stores user id of the student(s)
- student_password : Stores password of the student(s)
- first_name : Stores first name of the student(s)
- last_name : Stores last name of the student(s)
- registration_date : Stores the registration date of the student(s).
- gender : Stores the gender of the student(s).
- date_of_birth : Stores the date of birth of the student(s).
- student_status : Stores the current status of the student account(s).
- contact_no : Stores the contact number of the student(s).
- qualification : Stores student(s) qualification.
- city : Stores the city in which the student(s) lives.
- email1 : Stores primary email of the student(s).
- email2 : Stores secondary email of the student(s).
- address : Stores the address of the student(s).
- description : Stores description of the student(s).
- resume : Stores resume of students(s).
- image : Stores image of the student(s).
- last_login_date : Stores last login date of the student(s).

Features

The Website provides following functionalities to the users :

☐ **Administrator :**

- Login/Logout
- View student information
- Edit Student Information
- Enable/disable student accounts
- Search students

☐ **Student :**

- Login/Logout
- View profile
- Edit profile
- Change password
- Register new profile

KAT(HARSHIT KUMAU)PVT LTD.MAIET

This is the registration page where students can register online.

Welcome to Student Information Management System

[Home](#) [New Student Click Here](#)

Student Login Here

Login Id :

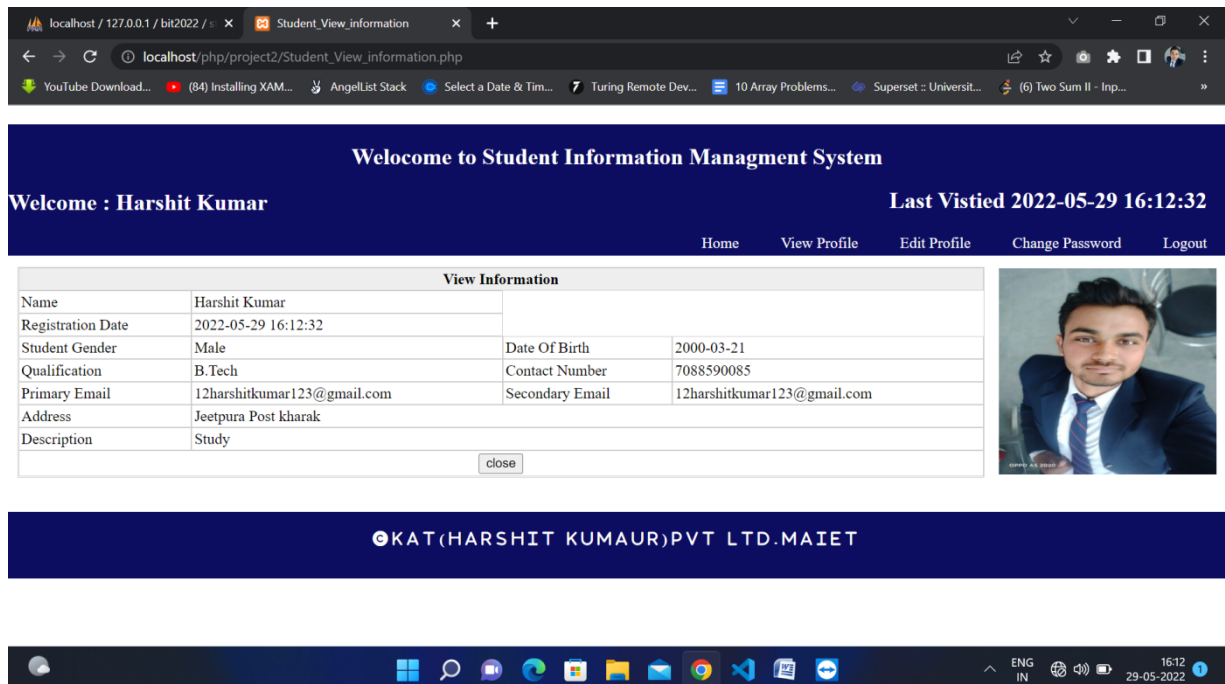

Password:

KAT(HARSHIT KUMAU)PVT LTD.MAIET

After successful registration the user account needs to be first enabled by the administrator. The students can then login into their accounts with the id and password they choose during registration. The above page shows student login page.

After logging in the student home page is opened as shown above.

The student can view their profile. The above page shows the user profile. The link to the resume is shown if a resume was uploaded during registration otherwise it's not shown.

The screenshot shows a web browser window with the URL `localhost/php/project2/Student_Edit_information.php`. The page has a dark blue header with the text "Welcome to Student Information Managment System" and "Welcome : Harshit Kumar". On the right, it says "Last Vistied 2022-05-29 16:12:32". Below the header is a navigation bar with links: Home, View Profile, Edit Profile, Change Password, and Logout. The main content area contains a form titled "Edit Information". The form has two columns of input fields. The left column includes: First Name *, Gender (radio buttons for Male and Female), Qualification * (a dropdown menu), City, Primary Email *, Address, and Description. The right column includes: Last Name *, Date Of Birth * (with a DD-MM-YYYY format), Contact No, and Secondary Email. At the bottom of the form are "Update" and "close" buttons. Below the form is a dark blue footer with the text "©KAT(HARSHIT KUMAUR)PVT LTD.MAIET". The Windows taskbar is visible at the bottom of the browser window.

Students can edit their profiles by using the edit profile option on their homepage.the above page is used for editing student information.

The screenshot shows a web browser window with the URL `localhost/php/project2/Student_change_password.php`. The page has a dark blue header with the text "Welcome to Student Information Managment System" and "Welcome : Harshit Kumar". On the right, it says "Last Vistied 2022-05-29 16:12:32". Below the header is a navigation bar with links: Home, View Profile, Edit Profile, Change Password, and Logout. The main content area contains a form titled "Reset Your Password". The form has three input fields: Login Id, Old Password, and New Password. At the bottom of the form are "Login" and "Close" buttons. Below the form is a dark blue footer with the text "©KAT(HARSHIT KUMAUR)PVT LTD.MAIET". The Windows taskbar is visible at the bottom of the browser window.

The students have the option to change their password.They need their old password in order to change the password.

SCOPE OF THE PROJECT

- ☐ The Student Information Management System(SIMS) can be enhanced to include some other functionality like marks,attendance management.
- ☐ Talent management of students based on their performance evaluation can be added.
- ☐ Social networking can also be added wherein students can interact with each other.
- ☐ Online class functionality can be added.
- ☐ Can evolve as an online institution.
- ☐ Functionality of chat and messages can be added.
- ☐ Online exam functionality can be added.
- ☐ Online resume builder functionality can also be added.

CONTRIBUTION IN THE PROJECT

Student information management system lead to a better organization structure since the information management of the students is well structured and also lead to better as well as efficient utilization of resources.

Student Information Management System can be used by education institutes to maintain the records of students easily. Achieving this objective is difficult using a manual system as the information is scattered, can be redundant and collecting relevant information may be very time consuming. All these problems are solved using this project

Our project Student Information Management System was developed by all three of us. We, a team of three persons took a step by step approach in order to reach our goal. We applied the knowledge we gained during our training period at **EN Technologies Pvt. Ltd.** and developed this project “**STUDENT INFORMATION MANAGEMENT SYSTEM**”.
